

# TIBPAL22V10-15BC

## HIGH-PERFORMANCE IMPACT-X™ PROGRAMMABLE ARRAY LOGIC

D3356, OCTOBER 1989—REVISED JUNE 1990

- Second-Generation PAL® Architecture
- High-Performance Operation:  
 $f_{max}$  (External Feedback) . . . 40 MHz  
 Propagation Delay . . . 15 ns Max
- Increased Logic Power – Up to 22 Inputs and 10 Outputs
- Increased Product Terms – Average of 12 per Output
- Variable Product Term Distribution Allows More Complex Functions to Be Implemented
- Each Output Is User Programmable for Registered or Combinatorial Operation, Polarity, and Output Enable Control
- Power-Up Clear on Registered Outputs
- TTL-Level Preload for Improved Testability
- Extra Terms Provide Logical Synchronous Set and Asynchronous Reset Capability
- Fast Programming, High Programming Yield, and Unsurpassed Reliability Ensured Using Ti-W Fuses
- AC and DC Testing Done at the Factory Utilizing Special Designed-In Test Features
- Dependable Texas Instruments Quality and Reliability
- Package Options Include Plastic Dual-In-Line and Chip Carrier Packages

### description

The TIBPAL22V10-15BC is a programmable array logic device featuring high speed and functional equivalency when compared to presently available devices. They are implemented with the familiar sum-of-products (AND-OR) logic structure featuring the new concept "Programmable Output Logic Macrocell". These IMPACT-X™ circuits combine the latest Advanced Low-Power Schottky technology with proven titanium-tungsten fuses to provide reliable, high-performance substitutes for conventional TTL logic.

These devices contain up to 22 inputs and 10 outputs. They incorporate the unique capability of defining and programming the architecture of each output on an individual basis. Outputs may be registered or nonregistered and inverting or noninverting as shown in the output logic macrocell diagram. The ten potential outputs are enabled through the use of individual product terms.

Further advantages can be seen in the introduction of variable product term distribution. This technique allocates from 8 to 16 logical product terms to each output for an average of 12 product terms per output. This variable allocation of terms allows far more complex functions to be implemented than in previously available devices.

This device is covered by U.S. Patent 4,410,987.

IMPACT-X is a trademark of Texas Instruments Incorporated.  
 PAL is a registered trademark of Monolithic Memories Inc.

PRODUCTION DATA documents contain information current as of publication date. Products conform to specifications per the terms of Texas Instruments standard warranty. Production processing does not necessarily include testing of all parameters.

**description (continued)**

Circuit design is enhanced by the addition of a synchronous set and an asynchronous reset product term. These functions are common to all registers. When the synchronous set product term is a logic 1, the output registers are loaded with a logic 1 on the next low-to-high clock transition. When the asynchronous reset product term is a logic 1, the output registers are loaded with a logic 0. The output logic level after set or reset depends on the polarity selected during programming. Output registers can be preloaded to any desired state during testing. Preloading permits full logical verification during product testing.

With features such as programmable output logic macrocells and variable product term distribution, the TIBPAL22V10' offers quick design and development of custom LSI functions with complexities of 500 to 800 equivalent gates. Since each of the ten output pins may be individually configured as inputs on either a temporary or permanent basis, functions requiring up to 21 inputs and a single output or down to 12 inputs and 10 outputs are possible.

A power-up clear function is supplied that forces all registered outputs to a predetermined state after power is applied to the device. Registered outputs selected as active-low power-up with their outputs high. Registered outputs selected as active-high power-up with their outputs low.

A single security fuse is provided on each device to discourage unauthorized copying of fuse patterns. Once blown, the verification circuitry is disabled and all other fuses will appear to be open.

The TIBPAL22V10-15BC is characterized for operation from 0°C to 75°C.

**absolute maximum ratings over operating free-air temperature range (unless otherwise noted)**

Supply voltage, V <sub>CC</sub> (see Note 1) .....	7 V
Input voltage (see Note 1) .....	5.5 V
Voltage applied to disabled output (see Note 1) .....	5.5 V
Operating free-air temperature range .....	0°C to 75°C
Storage temperature range .....	-65°C to 150°C

NOTE 1: These ratings apply except for programming pins during a programming cycle or during a preload cycle.

**recommended operating conditions**

		MIN	NOM	MAX	UNIT
V <sub>CC</sub>	Supply voltage	4.75	5	5.25	V
V <sub>IH</sub>	High-level input voltage	2		5.5	V
V <sub>IL</sub>	Low-level input voltage			0.8	V
I <sub>OH</sub>	High-level output current			-3.2	mA
I <sub>OL</sub>	Low-level output current			16	mA
t <sub>w</sub>	Pulse duration	Clock high or low	10		ns
		Asynchronous Reset high or low	15		
t <sub>su</sub>	Setup time before clock↑	Input	13		ns
		Feedback	13		
		Synchronous Preset (active)	13		
		Asynchronous Reset (inactive)	15		
t <sub>h</sub>	Hold time, input, set, or feedback after clock↑		0		ns
T <sub>A</sub>	Operating free-air temperature		0	75	°C

## electrical characteristics over recommended operating free-air temperature range

PARAMETER	TEST CONDITIONS		MIN	TYP†	MAX	UNIT
V <sub>IK</sub>	V <sub>CC</sub> = 4.75 V,	I <sub>I</sub> = -18 mA			-1.2	V
V <sub>OH</sub>	V <sub>CC</sub> = 4.75 V,	I <sub>OH</sub> = -3.2 mA	2.4	3.5		V
V <sub>OL</sub>	V <sub>CC</sub> = 4.75 V,	I <sub>OL</sub> = 16 mA	0.35	0.5	0.1	V
I <sub>OZH</sub>	V <sub>CC</sub> = 5.25 V,	V <sub>O</sub> = 2.7 V			0.1	mA
I <sub>OZL</sub>	V <sub>CC</sub> = 5.25 V,	V <sub>O</sub> = 0.4 V			-0.1	mA
I <sub>I</sub>	V <sub>CC</sub> = 5.25 V,	V <sub>I</sub> = 5.5 V		1		mA
I <sub>IIH</sub>	V <sub>CC</sub> = 5.25 V,	V <sub>I</sub> = 2.7 V		25		μA
I <sub>IL</sub>	CLK	V <sub>CC</sub> = 5.25 V,			-0.15	mA
	All others	V <sub>I</sub> = 0.4 V			-0.1	
I <sub>OS</sub> ‡	V <sub>CC</sub> = 5.25 V,	V <sub>O</sub> = 0.5 V	-30	-90		mA
I <sub>CC</sub>	V <sub>CC</sub> = 5.25 V,	V <sub>I</sub> = GND,	Outputs open	155	180	mA
C <sub>i</sub>	f = 1 MHz,	V <sub>I</sub> = 2 V		5.5		pF
C <sub>o</sub>	f = 1 MHz,	V <sub>O</sub> = 2 V		8		pF
C <sub>clk</sub>	f = 1 MHz,	V <sub>CLK</sub> = 2 V		7		pF

## switching characteristics over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted)

PARAMETER	FROM (INPUT)	TO (OUTPUT)	TEST CONDITION	MIN	TYP†	MAX	UNIT
f <sub>max</sub> §	External feedback		R <sub>1</sub> = 300 Ω, R <sub>2</sub> = 390 Ω, See Figure 2	40	60		MHz
t <sub>pd</sub>	I, I/O	I/O		11	15		ns
t <sub>pd</sub>	I, I/O (reset)	Q		13	20		ns
t <sub>pd</sub>	Clock	Q		7	12		ns
t <sub>pd</sub>	Clock	I/O		15	22		ns
t <sub>en</sub>	I, I/O	I/O, Q		11	15		ns
t <sub>dis</sub>	I, I/O	I/O, Q		11	15		ns

† All typical values are at V<sub>CC</sub> = 5 V, T<sub>A</sub> = 25°C.‡ Not more than one output should be shorted at a time, and the duration of the short circuit should not exceed one second. V<sub>O</sub> is set at 0.5 V to avoid test problems caused by test equipment ground degradation.

$$\$ f_{\max} (\text{with feedback}) = \frac{1}{t_{su} + t_{pd} (\text{CLK to } Q)} .$$

**preload procedure for registered outputs (see Note 2)**

The output registers can be preloaded to any desired state during device testing. This permits any state to be tested without having to setup through the entire state-machine sequence. Each register is preloaded individually by following the steps given below:

- Step 1. With  $V_{CC}$  at 5 V and pin 1 at  $V_{IL}$ , raise pin 13 to  $V_{IHH}$ .
- Step 2. Apply either  $V_{IL}$  or  $V_{IH}$  to the output corresponding to the register to be preloaded.
- Step 3. Pulse pin 1, clocking in preload data.
- Step 4. Remove output voltage, then lower pin 13 to  $V_{IL}$ . Preload can be verified by observing the voltage level at the output pin.

**preload waveforms (see Notes 2 and 3)**

NOTES: 2. Pin numbers shown are for the NT package only. If chip-carrier socket adapter is not used, pin numbers must be changed accordingly.  
3.  $t_d = t_{SU} = t_w = 100$  ns to 1000 ns.  $V_{IHH} = 10.25$  V to 10.75 V.

### power-up reset

Following power-up, all registers are reset to zero. The output level depends on the polarity selected during programming. This feature provides extra flexibility to the system designer and is especially valuable in simplifying state-machine initialization. To ensure a valid power-up reset, it is important that the rise of  $V_{CC}$  be monotonic. Following power-up reset, a low-to-high clock transition must not occur until all applicable input and feedback setup times are met.

### power-up reset waveforms

<sup>†</sup> This is the power-up reset time and applies to registered outputs only. The values shown are from characterization data.

<sup>‡</sup> This is the setup time for input or feedback.

### programming information

Texas Instruments programmable logic devices can be programmed using widely available software and inexpensive device programmers.

Complete programming specifications, algorithms, and the latest information on hardware, software, and firmware are available upon request. Information on programmers capable of programming Texas Instruments programmable logic is also available, upon request, from the nearest TI field sales office, local authorized TI distributor, or by calling Texas Instruments at (214) 997-5666.

**TIBPAL22V10-15BC**  
**HIGH-PERFORMANCE IMPACT-X™ PROGRAMMABLE ARRAY LOGIC**

**PARAMETER MEASUREMENT INFORMATION**

NOTES: A.  $C_L$  includes probe and jig capacitance and is 50 pF for  $t_{pd}$  and  $t_{EN}$ , 5 pF for  $t_{DIS}$ .  
 B. All input pulses have the following characteristics: PRR  $\leq$  1 MHz,  $t_r = t_f = 2$  ns, duty cycle = 50%.  
 C. Waveform 1 is for an output with internal conditions such that the output is low except when disabled by the output control. Waveform 2 is for an output with internal conditions such that the output is high except when disabled by the output control.  
 D. When measuring propagation delay times of 3-state outputs, switch S1 is closed.  
 E. Equivalent loads may be used for testing.
